

Delivery approach

A practical two-and-a-half-day plan for the MiniCAD assessment.

PRIMARY OUTCOME

Deliver one working loop: a dispatcher logs and broadcasts an incident; an on-duty officer receives it, claims it, updates status, files a report, and the dispatcher sees every change without refreshing.

REQUIREMENTS

Functional

- Seeded dispatcher and officer login
- Incident intake and pool dispatch
- Officer-controlled availability
- Push, first-wins claim, live status
- Final report and dispatcher archive

Non-functional

- Realtime updates, no polling or refresh
- Database-enforced ownership and order
- Role-based access with RLS
- Responsive, clear loading and errors
- Installable Android preview build

ONE SHARED OPERATIONAL BACKEND

Private invalidations trigger fresh RLS-authorized snapshots; push is sent server-side.

Seeded accounts

Text reports

Android first

Realtime first

Phases and checkpoints

Each phase ends with something demonstrable, not only code in progress.

SCOPE GUARDRAILS

No public sign-up, no photos, no manual one-to-one assignment, and no polling. If time is tight, preserve the secure realtime core before adding optional filtering or history polish.
